

Print with your mobile phone

Facility to be ready by 2008

SALEM: Modern mobile phones these days can be used for listening to songs, taking pictures, recording audio and video, storing data and writing documents.

One of the capabilities that the gadget does not have is printing. But soon the mobile phone can also print your documents and photographs.

Many of us might think that it is impossible. But the President and Chief Executive Officer of PrintDreams, Sweden, Alex Breton, says, "It is possible."

Visit

He visited the facilities in the Sona College of Technology here and interacted with the officials of Vee Technologies, a technology service provider having offices in Salem and Bangalore, which provides engineering services to PrintDreams.

PrintDreams, a Swedish Technology Company, was designing such a gadget.

Invented

"We have already invented a hand-held device which can print when moved across a paper, wedding card or any material on which we can

- Can be used to print documents and photographs

print. "This device has already been introduced in the US market.

Device

"Now we are designing a device that can be integrated in the mobile phone with the capability to print and scan.

"When the mobile phone is moved closely over the surface of a paper, it can print the image or document," Mr. Alex Breton told reporters here recently.

The mobile phone with printing capability was expected to be ready in 2008, Mr. Alex Breton said.

Available sizes

One could use the mobile phone with printing capability to print documents of commonly available sizes of paper and on toys, cardboards and wedding cards, he added.

Managing Director of Vee Technologies Chokalingam Valliappa accompanied him.
